

Rewards System

Overview

The purpose of this assessment is to build a working points-based loyalty and rewards system for a Shopify store. You can implement the system using your own backend , in any language or framework (Laravel will be preferred) they prefer, and their own free-trial Shopify development store.

The use of a third-party loyalty application is not permitted. The system must talk to Shopify directly through its API and must be a genuine, working implementation rather than a mock-up or description.

Section 1 : Earning Points

Points are awarded to customers for the following actions and under the following conditions.

Action	Points Awarded	Conditions
Make a purchase	2 points per £1 spent	Calculated on the amount actually paid after discounts. Points are subject to a 14-day hold before they become spendable.
Create an account	200 points	One-time only, per customer.
Newsletter signup	100 points	One-time only. Awarded only on a genuine opt-in, and not on every profile save.
Birthday	250 points	Once per calendar year, based on a date the customer provides.

Section 2 : Spending Points

The conversion rate for spending is 100 points to £1. Customers may redeem accumulated points for the following rewards.

Reward	Points Required	Description
Money off (small)	500 points	£5 off the customer's next order.
Free shipping	500 points	Waives the shipping charge on the customer's next order.
Free product	1,500 points	The customer selects one item from a curated collection of eligible products. Shipping is still charged normally.

Reward	Points Required	Description
Gift card	2,500 points	A £25 store gift card.

Section 3 : Requirements

The implementation must satisfy each of the following requirements.

1. Points must be earned through real Shopify events delivered by webhook. Manual test buttons or otherwise simulated triggers are not acceptable as the mechanism for awarding points.
2. Every redemption must create a real, usable Shopify object an actual discount code or gift card generated through the Admin API. A code invented independently of Shopify will not be accepted.
3. A customer's balance must be fully traceable and auditable from transaction history at any point in time. A single stored figure trusted at face value is not sufficient.
4. The Free Product flow must independently verify, on the server side, that the chosen item genuinely belongs to the eligible collection before the reward is granted.

Section 4 : Constraints

1. All work must be carried out in a sandbox environment.
2. The task is time-boxed. A smaller system built correctly is valued more highly than a larger system built shakily.

Section 5 : Deliverables

The candidate is expected to submit the following.

1. A link to the code.
2. A short walkthrough, either recorded or presented live, showing a customer earning points from a real order and redeeming one reward end-to-end.
3. A brief written explanation.
